## Available Pages

- 0.0 Preface
  - Riverbend Coffee and Tea Company
- 1.0 Primer
  - HTML primer
    - Content type
    - DOCTYPE
    - Working with HTML in Domino
  - Java primer
    - A simple Java program
    - Introduction to applets
    - Introduction to classes and objects
    - Working with Java in Domino Designer
  - JavaScript primer
    - DHTML
    - The Document Object Model
    - Using JavaScript with HTML
    - Working with JavaScript in Domino Designer
  - Styles and CSS primer
  - Web 2.0 primer
    - Introduction to AJAX
    - Introduction to JSON
  - Web services primer
  - Web standards primer
    - Application programming interface
  - XML primer
- 2.0 Getting started
  - Architectural, project, and visual design considerations
    - Architectural patterns
    - Thoughts about content
  - Domino Web capabilities
  - Planning for accessibility and compliance
  - Understanding the Web browser client environment
- 3.0 Understanding the Domino design elements

- Database
  - Default Launch Elements
  - Tab specific database functionality
- Domino design elements
  - A design elements overview
    - Adding HTML to a design
    - All Domino URLs
    - CGI variables
    - Changing the content type of a design element
    - Common design properties on Web applications
    - Styling text for the Web
    - Working with the DOCTYPE
  - Agent design elements
  - Applet design elements
  - Design element multi-aliasing
  - File resources design elements
  - Folder design elements
  - Form design elements
    - HTMLOptions and HTMLTagAttribute fields
    - Special reserved fields
    - Understanding the form HTML source code
    - Using forms versus pages
  - Frameset design elements
  - Image resource design elements
  - Java library design elements
  - JavaScript library design elements
  - LotusScript library design elements
  - Page design elements
    - Using pages to submit data
  - Profile documents
  - Shared field design elements
  - Subforms design elements
  - View design elements
    - Rapid application development
    - SearchTemplate
  - Web service design elements
- 4.0 Building Domino Web applications
  - Error handling
  - Input validation - Client side
  - Input validation - Server side
  - Interactive data (Web 2.0)
  - Login screens
    - Built-in forms using \$\$LoginUserForm
    - Custom login screens using Domcfg.nsf
    - Database that came with Domino R5

- Navigation techniques
  - Moving past the frameset - Making Web-based applications that do not look like Lotus Notes
  - No more twisties - Using single category and a combobox to filter the view
  - View-based menus
- Personalization
- Searching
  - Creating custom and advanced searches using Domino
    - Customizing the search results display
    - Searching via Domino URL commands
    - Searching via FTsearch and DBSearch
  - robots.txt
  - Search engines and search engine optimization
  - SEO techniques
- URL considerations
- User management
- Using interactive data and Web services
- Working with data
  - JSON
  - RSS
  - Using query views
- 5.0 Extending rich client applications for Web clients
  - Benefits and pitfalls of extending rich client applications for Web clients
  - Data management in hybrid rich and Web client applications
  - Defining functional requirements based on client type
  - Developing hybrid rich client and Web client applications
- 6.0 Server configuration
  - Logging
  - Performance considerations
  - Security considerations
    - SSL support
      - Setting up SSL with a self-certified certificate
  - Server error handling
    - Global 404 error form
    - Web server configuration database
  - Topology
  - Working with Web site rules
    - Directory rules
    - HTTP Response Header rules
    - Overriding Session Authentication rules
    - Redirection and Substitution rules
- 7.0 Developer tools and resources
  - Domino resources
  - Web development resources

- Web development tools
- Looking ahead to version 8.5
